Domanda 1

Risposta corretta

Punteggio ottenuto
1,00 su 1,00

A transaction is atomic if

- ☐ (a) takes the system from a valid state to another valid state
- ☒ (b) all the operations that compose the transaction itself are completed, or are undone as if they had ever been performed ✓
- ☐ (c) none of the other answers are correct
- ☐ (d) makes permanent the changes made immediately after the end of the transaction itself
- ☐ (e) is performed in the system concurrently with other transactions, as if it were the only one to be executed

La risposta corretta è: all the operations that compose the transaction itself are completed, or are undone as if they had ever been performed

Domanda 2

Risposta corretta

Punteggio ottenuto

The SQL statement

```
CREATE TABLE T1  
(A1 CHAR (5) NOT NULL,  
A2 INTEGER,  
A3 CHAR (5) NOT NULL,  
PRIMARY KEY (A1, A3),  
FOREIGN KEY (A2) REFERENCES T2,  
ON UPDATE NO ACTION);
```

-
- ☒ (a) creates a T1 table in which it is required to prevent the execution of any UPDATE operation on T2 violating the referential integrity ✓
 - ☐ (b) none of the other answers are correct
 - ☐ (c) creates a table T1 in which, as a result of an UPDATE operation, no action is executed
 - ☐ (d) creates a table T1 where any UPDATE operation is prevented
 - ☐ (e) creates a T1 table in which, following an UPDATE operation on T2 that violates the referential integrity, no actions are executed

La risposta corretta è: creates a T1 table in which it is required to prevent the execution of any UPDATE operation on T2 violating the referential integrity

Domanda 3

Risposta corretta

Punteggio ottenuto

The PHP function mysqli_query()

-
- ☐ (a) is used for both the immediate execution and the prepared execution of SQL statements (subject to parameter binding)
 - ☐ (b) is used for the prepared execution of SQL statements
 - ☐ (c) none of the other answers are correct
 - ☒ (d) is used for the immediate execution of SQL statements ✓
 - ☐ (e) is used for displaying the result of a SQL query

La risposta corretta è: is used for the immediate execution of SQL statements

Domanda 4

Given the following relational tables:TEACHER (TeacherID, FirstName, LastName, Department)COURSE (CourseID, CourseName, Year, Semester, TeacherID, Language)

Select the first and last names of the teachers of the Electronics department who teach at least two English-language courses in the first semester of the second year.

Assignment for the exercise:

The following query tree graphically represents the requested algebraic query. You are requested to indicate, for each box in the query tree (i.e., A, B, C, D, E, F, G, and H box), the relational table or the corresponding algebraic operator. Use the text box below to provide your solution. Note: each box in the query tree is associated with only one relational table or one algebraic operator.

A, COURSE C1

B COURSE C2

C `SELECTION(Language="English" AND Year=2 AND Semester=1)`

D SELECTION(Language="English" AND Year=2 AND Semester=1)
E THETA JOIN (C1.CourseID<>C2.CourseID AND C1.TeacherID=C2.TeacherID)
F SELECTION(Department="Electronic")
G NATURAL JOIN
H PROJECTION(FirstName, LastName)

Given the following relational tables

TEACHER (TeacherID, FirstName, LastName, Department)
COURSE (CourseID, CourseName, Year, Semester, MainTeacherID, Language)
STUDENT (StudentID, FirstName, LastName, BirthDate, Nationality)
STUDENT-COURSE-ENROLLMENT (CourseID, StudentID, EnrollmentYear)
STREAMING-VIDEOLECTURE (VideoLectureID, CourseID, Topic, Date, DurationInMinutes, TeacherID)
STREAMING-VIDEOLECTURE-ATTENDANCE (StudentID, VideoLectureID, CourseID, AttendanceInMinutes)

Write the following query in SQL language:

Select the student ID, first name, last name, and nationality of each student who has never attended a streaming video-lecture longer than 10% of the video-lecture duration.

Assignment for the exercise

Use the text box below to provide your solution.

```
SELECT StudentID, FirstName, LastName, Nationality
FROM STUDENT
WHERE StudentID NOT IN
    (SELECT StudentID
     FROM STREAMING-VIDEOLECTURE-ATTENDANCE SVA, STREAMING-VIDEOLECTURE
     SV
     WHERE SVA.VideoLectureID=SV.VideoLectureID AND SVA.CourseID=SV.CourseID
     AND AttendanceInMinutes>0.1*DurationInMinutes
    )
```

Given the following relational tables

TEACHER (TeacherID, FirstName, LastName, Department)
COURSE (CourseID, CourseName, Year, Semester, TeacherID, Language)
STUDENT (StudentID, FirstName, LastName, BirthDate, Nationality)
STUDENT-COURSE-ENROLLMENT (CourseID, StudentID, EnrollmentYear)
STREAMING-VIDEOLECTURE (VideoLectureID, CourseID, Topic, Date, DurationInMinutes, TeacherID)
STREAMING-VIDEOLECTURE-ATTENDANCE (StudentID, VideoLectureID, CourseID, AttendanceInMinutes)

Write the following query in SQL language:

For each student enrolled in at least 3 courses in the 2019-2020 enrollment year, select the student ID and last name, and the ID of each course for which the student attended all streaming video-lectures of that course.

Assignment for the exercise

Use the text box below to provide your solution.

```
SELECT S.StudentID, S.LastName, SVA.CourseID
FROM STUDENT S, STREAMING-VIDEOLECTURE-ATTENDANCE SVA
WHERE S.StudentID=SVA.StudentID
      AND S.StudentID IN
      (SELECT StudentID
       FROM STUDENT-COURSE-ENROLLMENT
       WHERE EnrollmentYear="2019-2020"
       GROUP BY StudentID
       HAVING COUNT(*)>=3
      )
GROUP BY S.StudentID, S.LastName, SVA.CourseID
HAVING COUNT (*) =
      (SELECT COUNT(*)
       FROM STREAMING-VIDEOLECTURE SV
       WHERE SV.CourseID= SVA.CourseID)

/* or maybe you can try something like
HAVING COUNT(*)=
      (SELECT Number
       FROM (SELECT CourseID, COUNT(*) AS Number
              FROM STREAMING-VIDEOLECTURE SV
              GROUP BY CourseID) AS res
       WHERE res.CourseID=SVA.CourseID)
```

2,00**Describe the Entity-Relationship diagram corresponding to the following specifications.**

You are requested to design the database for managing the users of a COVID-19 infection-tracking mobile app.

Users of the app are characterized by their SSN (Social Security Number), first name, last name, date of birth, and place of residence. Users are divided into occasional users and registered users.

For registered users, their Local Health Agency and their registration date are known, whereas for occasional users, the brand and type of their mobile device are known. The Local Health Agency is identified by its reference city and a code (e.g. Turin TO1) and is characterized by an email address, a venue, and a list of phone numbers.

Directions for the exercise to run

Use the text box below to return the ER diagram in text form. Alternatively, you can use the drawing box to graphically represent the ER diagram.

ENTITY: USER

Int ID: SSN

Attr: firstname, lastname, dateofbirth, placeofresidence

HIERARCLY(t,e):

child entity: OCCASIONAL

attr: brandDevice, typeDevice

child entity: REGISTERED

attr: RegistrationDate, (City,Code) REFERENCES LOCAL_HEALTH_AGENCY(City,Code)

ENTITY: LOCAL_HEALTH_AGENCY

Int ID: (City,Code)

Attr: Email, venue, ListOfPhone(0,N)

RELATIONSHIPS: REGISTERED-IN

REGISTERED(1,1)- LOCAL_HEALTH_AGENCY (0,N)

Describe the Entity-Relationship diagram for the following specifications.

You want to design the database for handling alert messages for an app that is useful for tracking COVID-19 infections.

App users are identified by a code and are characterized by their first and last name. If the app incurs an issue or the Bluetooth protocol is turned off, the app notifies an alert to the user. Each alert notification is identified by a unique code and is characterized by a predefined message text (e.g. "The Bluetooth connection is turned off. Restore it as soon as possible.").

For each user, record the date and time of receipt of the alert notifications. Assume that the same alert notification can be sent multiple times to the same user (i.e., several times on the same date with different times or on different dates) or to different users (on the same date and time, or on different dates and/or times).

Directions for the exercise to run

Use the text box below to return the ER diagram in text form. Alternatively, you can use the drawing box to graphically represent the ER diagram.

ENTITY: USER

Int ID: UCode

Attr: firstname, lastname

ENTITY: ALERT_NOTIFICATION

Int ID: ACode

Attr: text

ENTITY: TIME

Int ID: Date, Time

RELATIONSHIP: SEND-ALERT-NOTIFICATION

USER(0,N)- ALERT_NOTIFICATION(0,N)- TIME(1,N)

Describe the Entity-Relationship diagram for the following specifications.

You want to design the data base for managing notifications of an app useful for co-tracking COVID-19 infections and doctor visits booked by users

The users of the app are identified by a code and are characterized by their first and last name. Users receive notifications of potential exposure to infection. Each notification is identified by a progressive number, unique for each user, and is characterized by a description and a specific risk level.

Users can book medical visits to doctors in the area. Each doctor, identified by the VAT registration number, has a first name, last name, and number of years of experience. For each booking of a medical examination, you are requested to record the date, the requesting user, the doctor in charge of performing the examination, and the place where the examination will be held. Assume that a user can book multiple visits on different dates with the same doctor or with different doctors, but on the same date a user can book at most one examination. Assume also that a doctor can have multiple examinations on the same date.

Directions for the exercise

Use the text box below to store the ER diagram in text form. Alternatively, you can use the drawing box to graphically represent the ER diagram.

ENTITY: USER

Int ID: UCode

Attr: firstname, lastname

ENTITY: NOTIFICATION

Int ID: Progressive#

Given the following Entity-Relationship diagram

You are required to:

- Provide a normalized relational logical schema for the same database (N.B. It is not mandatory to report the restructured E-R diagram)
- Define referential integrity constraints for 2 relationships of your choice among those defined in the conceptual schema

Assignment

Use the text box below to provide your solution.

EMPLOYEE(CodeE, NameE)LIFEGUARD(CodeE, Qualification)TIME(SDate)WORK_AT(CodeE, SDate, CodeS, EndDate, JobRole)SEASIDE_RESORT(CodeS, NameS, WebPage*)BEACH_SEAT(CodeBS, CodeS, sea_distance, CodePR)PRICE_RANGE(CodePR, Amount)

1) WORK_AT(CodeE) REFERENCES EMPLOYEE(CodeE)

WORK_AT(SDate) REFERENCES TIME(SDate)

WORK_AT(CodeS) REFERENCES SEASIDE_RESORT(CodeS)

2) BEACH_SEAT(CodeS) REFERENCES SEASIDE_RESORT(CodeS)

BEACH_SEAT(CodePR) REFERENCES PRICE_RANGE(CodePR)

The following relational schema is given (primary keys are underlined):STUDENT (StudentID, Name, Surname, MasterDegree)COURSE (CourseID, Name, NumOfCredits)EXAM (StudentID, CourseID, Date, Mark)STUDENT_CAREER_INFO_NOTIFICATION (StudentID, RequestDate, NumOfPassedExams)STUDENT_CAREER_REQUEST (RequestID, StudentID, RequestDate)

A student requests her/his career information (i.e., insertion of a record in the table STUDENT_CAREER_REQUEST). Write the trigger to address the following activities.

The number of exams passed by the student must be calculated. The EXAM table contains the list of exams taken by students. Consider that an exam is passed if the mark is greater than or equal to 18.

If the student has not passed any exam, the trigger ends with an error. Otherwise, a new record must be inserted in the STUDENT_CAREER_INFO_NOTIFICATION table with the computed information.

Indications for carrying out the exercise:

Given the following incomplete solution of the trigger, you are asked to complete Part A in bold by specifying the body of the trigger. Use the text box below to provide your solution.

Use the `raise_application_error (...)` function to raise an error. It is not required to specify the parameters passed to the function.

```
create or replace trigger StudentCareerInfo
after insert on STUDENT_CAREER_REQUEST
for each row
```

Part A

DECLARE

CounterPassedExam Number;

BEGIN

SELECT COUNT(*) INTO CounterPassedExam

FROM EXAM

WHERE StudentID=:NEW.StudentID AND Mark>=18;

IF(CounterPassedExam =0) THEN

raise_application_error ();

END IF;

INSERT INTO STUDENT_CAREER_INFO_NOTIFICATION

VALUES(NEW.StudentID, NEW.RequestDate, CounterPassedExam);

END;
